# Perimeter-Area Problem 

6 January 2019

Jim Stevenson

James Tanton posted the following interesting problem on his Twitter account:
James Tanton, 6 January 2019 06:26 AM
(https://twitter.com/jamestanton/status/1081919893459546112)
A square of area A, perimeter P. For which values $0<r<1$ is there a line across the square that chops off $r A$ of the area and $r P$ of the perimeter as shown? $(r=1 / 2$, yes; $r=1 / 3$, no.)

## Solution

Unfortunately the only approach I could find involved an argument by cases, which I generally dislike. There may be a more elegant solution, but it was not immediately obvious.

There are a number of symmetries that reduce the scope of the problem. First, let $\mathrm{P}^{\prime}=r \mathrm{P}$ and $\mathrm{A}^{\prime}=$ $r A$. Then $r=P^{\prime} / P=A^{\prime} / A$. Notice that the complementary perimeter and area also satisfies equal ratios if the originals did. That is, $\left(\mathrm{P}-\mathrm{P}^{\prime}\right) / \mathrm{P}=1-\mathrm{r}=\left(\mathrm{A}-\mathrm{A}^{\prime}\right) / \mathrm{A}$. And finally, any line through the center of the square divides the square and its perimeter into congruent pieces and therefore of equal length and area, respectively. In which case, such a line satisfies the case $\mathrm{P}^{\prime} / \mathrm{P}=\mathrm{A}^{\prime} / \mathrm{A}=1 / 2$ (Figure 1). Thus, we only need to consider cases for which the area $A^{\prime}$ does not contain the center of the square.

We shall now consider two cases as shown in Figure 2 and Figure 3 where we have assigned the length 1 to the side of the square without any loss of generality. By the mirror symmetry about the vertical line through the center of the square, these two cases suffice. We let $\mathrm{s}_{0}$ be the distance of a fixed point along the left edge of the square from the top edge. We let s be the distance of a variable point along the top edge from the left edge.

Figure 1 Line Through Center $\Rightarrow \mathbf{r}=\mathbf{1 / 2}$

Figure 2 Case1: $0<\mathrm{s} \leq 1,0<\mathrm{s}_{0} \leq 1, \mathrm{~s}+\mathrm{s}_{0}<2$

Figure 3 Case 2: $0<\mathrm{s} \leq \mathrm{s}_{0} \leq 1, \mathrm{~s}+\mathrm{s}_{0}<1$

## Case 1: $0<s \leq 1,0<s_{0} \leq 1, s+s_{0}<2$ (Figure 2)

We constrain $\mathrm{s}+\mathrm{s}_{0}<2$, since $\mathrm{s}+\mathrm{s}_{0}=2$ represents a diagonal line through the center, and we already know that satisfies $r=1 / 2$. Then $\mathrm{P}=4$ and $\mathrm{P}^{\prime} / \mathrm{P}=\left(\mathrm{s}_{0}+\mathrm{s}\right) / 4$, and $\mathrm{A}=1$ and $\mathrm{A}^{\prime} / \mathrm{A}=(1 / 2) \mathrm{s}_{0} \mathrm{~s}$. Equating the two ratios yields

$$
\left(\mathrm{s}+\mathrm{s}_{0}\right)=2 \mathrm{~s}_{0} \mathrm{~s}
$$

or

$$
\mathrm{s}=\mathrm{s}_{0} /\left(2 \mathrm{~s}_{0}-1\right)
$$

But $\mathrm{s} \leq 1$ means $\mathrm{s}_{0} \leq\left(2 \mathrm{~s}_{0}-1\right)$ or $1 \leq \mathrm{s}_{0}$. But $\mathrm{s}_{0} \leq 1$, so $\mathrm{s}_{0}=1$. That means $\mathrm{s}=1$, or $\mathrm{s}+\mathrm{s}_{0}=2$, which has been disallowed. So no new value for $r$ has been found in this case.

Case 2: $0<s \leq s_{0} \leq 1, s+s_{0}<1$ (Figure 3)
We constrain $\mathrm{s}+\mathrm{s}_{0}<1$, since $\mathrm{s}+\mathrm{s}_{0}=1$ again represents a diagonal line through the center, and we have already considered that. Again by the mirror symmetry about a vertical line through the center of the square, we can assume $\mathrm{s} \leq \mathrm{s}_{0}$. Then $\mathrm{P}^{\prime} / \mathrm{P}=\left(\mathrm{s}_{0}+1+\mathrm{s}\right) / 4$, and $\mathrm{A}^{\prime} / \mathrm{A}=\mathrm{s}+(1 / 2) \mathrm{s}\left(\mathrm{s}_{0}-\mathrm{s}\right)$. Equating the two ratios eventually yields the quadratic

$$
2 s^{2}-\left(3+2 s_{0}\right) s+\left(s_{0}+1\right)=0
$$

which in turn, after a bunch of algebra, produces two potential solutions:

$$
\mathrm{s}=\mathrm{s}_{0}+1 \text { or } \mathrm{s}=1 / 2 .
$$

The first solution means $\mathrm{s}>1$, but we require $\mathrm{s} \leq 1$, so this solution is eliminated. If $\mathrm{s}=1 / 2$, then $\mathrm{s} \leq \mathrm{s}_{0}$ $\leq 1$ means $1 / 2 \leq \mathrm{s}_{0} \leq 1$. But $\mathrm{s}+\mathrm{s}_{0}<1$ implies $\mathrm{s}_{0}<1 / 2$. Hence, this solution is also eliminated. Therefore again no new value for $r$ has been found for this case.

Between Case 1 and Case 2 and all the symmetric versions, we have eliminated the equality of the ratios for any $r$ other than $1 / 2$ and for any line through the square other than one through the center. So the final answer is $\mathrm{r}=1 / 2$ yes and no for any other value of $0<r<1$.
